
The Island of Knights and Knaves: *There's an island in which certain inhabitants called "knights" always tell the truth, and others called "knaves" always lie. Every inhabitant of the island is either a knight or a knave.*

Three of the inhabitants—A, B, and C—were standing together in a garden. A stranger walked by and asked A, "How many knights are among you?" A answered, but rather indistinctly, so the stranger could not make out what he said. The stranger then asked B, "What did A say?" B replied, "A said that there is (exactly) one knight among us". At this point the third man, C, said, "Don't believe B; he is lying!"

Question: What are B and C?
